// Usage:
// f[0...N-1] and g[0..N-1] are numbers
// Want to compute the convolution h, defined by
// h[n] = sum of f[k]g[n-k] (k = 0, ..., N-1).
// Here, the index is cyclic; f[-1] = f[N-1], f
// [-2] = f[N-2], etc.
// Let F[0...N-1] be FFT(f), and similarly,
// define G and H.
// The convolution theorem says H[n] = F[n]G[n] (
// element-wise product).
// To compute h[] in  $O(N \log N)$  time, do the
// following:
// 1. Compute F and G (pass dir = 1 as the
// argument).
// 2. Get H by element-wise multiplying F and G
// .
// 3. Get h by taking the inverse FFT (use dir

```

4 Graph algorithms

4.1 Fast Dijkstra's algorithm

```

// Implementation of Dijkstra's algorithm using
// adjacency lists
// and priority queue for efficiency.
//
// Running time:  $O(|E| \log |V|)$ 

#include "template.h"
const int INF = 2000000000;

int main() {
    int N, s, t;
    scanf("%d%d%d", &N, &s, &t);
    vector<vector<pii>> edges(N);
    for (int i = 0; i < N; i++) {
        int M;
        scanf("%d", &M);
        for (int j = 0; j < M; j++) {
            int vertex, dist;
            scanf("%d%d", &vertex, &dist);
            edges[i].push_back(make_pair(dist, vertex));
            ; // note order of arguments here
        }
    }

    // use priority queue in which top element has
    // the "smallest" priority
    priority_queue<pii, vector<pii>, greater<pii>> >
        Q;
    vector<int> dist(N, INF), dad(N, -1);
    Q.push(make_pair(0, s));
    dist[s] = 0;
    while (!Q.empty()) {
        pii p = Q.top();
        Q.pop();
        int here = p.second;
        if (here == t) break;
        if (dist[here] != p.first) continue;

        for (vector<pii>::iterator it = edges[here].begin(); it != edges[here].end(); it++) {
            if (dist[here] + it->first < dist[it->second]) {
                dist[it->second] = dist[here] + it->first;
                dad[it->second] = here;
                Q.push(make_pair(dist[it->second], it->second));
            }
        }
    }

    printf("%d\n", dist[t]);
}

```

```

if (dist[t] < INF)
    for (int i = t; i != -1; i = dad[i])
        printf("%d%c", i, (i == s ? '\n' : ' '));
    return 0;
}

/*
Sample input:
5 0 4
2 1 2 3 1
2 2 4 4 5
3 1 4 3 3 4 1
2 0 1 2 3
2 1 5 2 1

Expected:
5
4 2 3 0
*/

```

4.2 Topological sort (C++)

```

// This function uses performs a non-recursive
// topological sort.
//
// Running time:  $O(|V|^2)$ . If you use adjacency
// lists (vector<map<int>>),
// the running time is reduced to  $O(|E|)$ .
//
// INPUT: w[i][j] = 1 if i should come before
// j, 0 otherwise
// OUTPUT: a permutation of 0,...,n-1 (stored
// in a vector)
// which represents an ordering of the
// nodes which
// is consistent with w
//
// If no ordering is possible, false is returned.
// TODO Optimization required

#include <iostream>
#include <queue>
#include <cmath>
#include <vector>

using namespace std;

typedef double T;
typedef vector<T> VT;
typedef vector<VT> VVT;

typedef vector<int> VI;
typedef vector<VI> VVI;

bool TopologicalSort (const VVI &w, VI &order) {
    int n = w.size();
    VI parents (n);
    queue<int> q;
    order.clear();

    for (int i = 0; i < n; i++) {
        for (int j = 0; j < n; j++) {
            if (w[j][i]) parents[i]++;
            if (parents[i] == 0) q.push (i);
        }
    }

    while (q.size() > 0) {
        int i = q.front();
        q.pop();
    }
}

```

```

order.push_back (i);
for (int j = 0; j < n; j++) if (w[i][j]) {
    parents[j]--;
    if (parents[j] == 0) q.push (j);
}
}

return (order.size() == n);
}

```

4.3 Union-find set(aka DSU)

```

#include "template.h"

int find(vector<int> &C, int x) { return (C[x] ==
x) ? x : C[x] = find(C, C[x]); }

void merge(vector<int> &C, int x, int y) { C[find
(C, x)] = find(C, y); }

int main() {
    int n = 5;
    vector<int> C(n);
    for (int i = 0; i < n; i++) C[i] = i;
    merge(C, 0, 2);
    merge(C, 1, 0);
    merge(C, 3, 4);
    for (int i = 0; i < n; i++) cout << i << " " <<
        find(C, i) << endl;
    return 0;
}

```

4.4 Strongly connected components

```

#include "template.h"
#define MAXE 1000000
#define MAXV 100000
struct edge{int e, nxt;};
int V, E;
edge e[MAXE], er[MAXE];
int sp[MAXV], spr[MAXV];
int group_cnt, group_num[MAXV];
bool v[MAXV];
int stk[MAXV]; // Stack, stk[0] stores size
void fill_forward(int x) {
    int i;
    v[x]=true;
    for(i=sp[x];i;i=e[i].nxt) if(!v[e[i].e])
        fill_forward(e[i].e);
    stk[++stk[0]]=x;
}

void fill_backward(int x) {
    int i;
    v[x]=false;
    group_num[x]=group_cnt;
    for(i=spr[x];i;i=er[i].nxt) if(v[er[i].e])
        fill_backward(er[i].e);
}

void add_edge(int v1, int v2) { //add edge v1
->v2
    e[++E].e=v2; e[E].nxt=sp[v1]; sp[v1]=E;
    er[E].e=v1; er[E].nxt=spr[v2]; spr[v2]=E;
}

void SCC() {
    int i;
}

```

```

stk[0]=0;
memset(v, false, sizeof(v));
for(i=1;i<=V;i++) if(!v[i]) fill_forward(i);
group_cnt=0;
for(i=stk[0];i>=1;i--) if(v[stk[i]]){group_cnt
    ++; fill_backward(stk[i]);}
}

int main() {return 0;}

```

4.5 Bellman Ford's algorithm

```

// This function runs the Bellman-Ford algorithm
// for single source
// shortest paths with negative edge weights.
// The function returns
// false if a negative weight cycle is detected.
// Otherwise, the
// function returns true and dist[i] is the
// length of the shortest
// path from start to i.
//
// Running time: O(|V|^3)
//
// INPUT:  start, w[i][j] = cost of edge from
//         i to j
// OUTPUT: dist[i] = min weight path from
//         start to i
//         prev[i] = previous node on the best
//         path from the
//         start node

#include <iostream>
#include <queue>
#include <cmath>
#include <vector>

using namespace std;

                }
            }
        }
    }

    return true;
}

```

4.6 Minimum Spanning Tree: Kruskal

```

/*
Uses Kruskal's Algorithm to calculate the weight
of the minimum spanning
forest (union of minimum spanning trees of each
connected component) of
a possibly disjoint graph, given in the form of a
matrix of edge weights
(-1 if no edge exists). Returns the weight of the
minimum spanning
forest (also calculates the actual edges - stored
in T). Note: uses a
disjoint-set data structure with amortized (
effectively) constant time per
union/find. Runs in O(E*log(E)) time.
*/
#include "template.h"

typedef int T;
struct edge{
    int u, v;
    T d;
};

struct edgeCmp{
    int operator()(const edge& a, const edge& b) {

Combinatorics

Sums

$$\begin{array}{ll} \sum_{k=0}^n k = n(n+1)/2 & \binom{n}{k} = \frac{n!}{(n-k)!k!} \\ \sum_{k=a}^b k = (a+b)(b-a+1)/2 & \binom{n}{k} = \binom{n-1}{k} + \binom{n-1}{k-1} \\ \sum_{k=0}^n k^2 = n(n+1)(2n+1)/6 & \binom{n+1}{k} = \frac{n+1}{n-k+1} \binom{n}{k} \\ \sum_{k=0}^n k^3 = n^2(n+1)^2/4 & \binom{n}{k+1} = \frac{n-k}{k+1} \binom{n}{k} \\ \sum_{k=0}^n k^4 = (6n^5 + 15n^4 + 10n^3 - n)/30 & \binom{n}{k} = \frac{n}{n-k} \binom{n-1}{k} \\ \sum_{k=0}^n k^5 = (2n^6 + 6n^5 + 5n^4 - n^2)/12 & \binom{n}{k} = \frac{n-k+1}{k} \binom{n-1}{k-1} \\ \sum_{k=0}^n x^k = (x^{n+1} - 1)/(x - 1) & 12! \approx 2^{28.8} \\ \sum_{k=0}^n kx^k = (x - (n+1)x^{n+1} + nx^{n+2})/(x-1)^2 & 20! \approx 2^{61.1} \\ 1 + x + x^2 + \dots = 1/(1-x) \end{array}$$

Binomial coefficients

Number of ways to pick a multiset of size k from n elements: $\binom{n+k-1}{k}$
 Number of n -tuples of non-negative integers with sum s : $\binom{s+n-1}{n-1}$, at most s : $\binom{s+n}{n}$
 Number of n -tuples of positive integers with sum s : $\binom{s-1}{n-1}$
 Number of lattice paths from $(0,0)$ to (a,b) , restricted to east and north steps: $\binom{a+b}{a}$
Multinomial theorem. $(a_1 + \dots + a_k)^n = \sum \binom{n}{n_1, \dots, n_k} a_1^{n_1} \dots a_k^{n_k}$, where $n_i \geq 0$ and $\sum n_i = n$.

$$\binom{n}{n_1, \dots, n_k} = M(n_1, \dots, n_k) = \frac{n!}{n_1! \dots n_k!}$$

$$M(a, \dots, b, c, \dots) = M(a + \dots + b, c, \dots)M(a, \dots, b)$$

Catalan numbers. $C_n = \frac{1}{n+1} \binom{2n}{n}$. $C_0 = 1$, $C_n = \sum_{i=0}^{n-1} C_i C_{n-1-i}$. $C_{n+1} = C_n \frac{4n+2}{n+2}$.
 $C_0, C_1, \dots = 1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862, 16796, 58786, 208012, 742900, \dots$
 C_n is the number of: properly nested sequences of n pairs of parentheses; rooted ordered binary trees with $n+1$ leaves; triangulations of a convex $(n+2)$ -gon.

Derangements. Number of permutations of $n = 0, 1, 2, \dots$ elements without fixed points is $1, 0, 1, 2, 9, 44, 265, 1854, 14833, \dots$. Recurrence: $D_n = (n-1)(D_{n-1} + D_{n-2}) = nD_{n-1} + (-1)^n$. Corollary: number of permutations with exactly k fixed points is $\binom{n}{k} D_{n-k}$.

Stirling numbers of 1st kind. $s_{n,k}$ is $(-1)^{n-k}$ times the number of permutations of n elements with exactly k permutation cycles. $|s_{n,k}| = |s_{n-1,k-1}| + (n-1)|s_{n-1,k}|$. $\sum_{k=0}^n s_{n,k} x^k = x^n$

Stirling numbers of 2nd kind. $S_{n,k}$ is the number of ways to partition a set of n elements into exactly k non-empty subsets. $S_{n,k} = S_{n-1,k-1} + kS_{n-1,k}$. $S_{n,1} = S_{n,n} = 1$. $x^n = \sum_{k=0}^n S_{n,k} x^{\underline{k}}$

Bell numbers. B_n is the number of partitions of n elements. $B_0, \dots = 1, 1, 2, 5, 15, 52, 203, \dots$.
 $B_{n+1} = \sum_{k=0}^n \binom{n}{k} B_k = \sum_{k=1}^n S_{n,k}$. Bell triangle: $B_r = a_{r,1} = a_{r-1,r-1}$, $a_{r,c} = a_{r-1,c-1} + a_{r,c-1}$.

Bernoulli numbers. $\sum_{k=0}^{m-1} k^n = \frac{1}{n+1} \sum_{k=0}^n \binom{n+1}{k} B_k m^{n+1-k}$.
 $\sum_{j=0}^m \binom{m+1}{j} B_j = 0$. $B_0 = 1$, $B_1 = -\frac{1}{2}$. $B_n = 0$, for all odd $n \neq 1$.

Eulerian numbers. $E(n, k)$ is the number of permutations with exactly k descents ($i : \pi_i < \pi_{i+1}$) / ascents ($\pi_i > \pi_{i+1}$) / excedances ($\pi_i > i$) / $k+1$ weak excedances ($\pi_i \geq i$).

Formula: $E(n, k) = (k+1)E(n-1, k) + (n-k)E(n-1, k-1)$. $x^n = \sum_{k=0}^{n-1} E(n, k) \binom{x+k}{n}$.

Burnside's lemma. The number of orbits under group G 's action on set X : $|X/G| = \frac{1}{|G|} \sum_{g \in G} |X_g|$, where $X_g = \{x \in X : g(x) = x\}$. ("Average number of fixed points.")

Let $w(x)$ be weight of x 's orbit. Sum of all orbits' weights: $\sum_{o \in X/G} w(o) = \frac{1}{|G|} \sum_{g \in G} \sum_{x \in X_g} w(x)$.

Number Theory

Linear diophantine equation. $ax + by = c$. Let $d = \gcd(a, b)$. A solution exists iff $d|c$. If (x_0, y_0) is any solution, then all solutions are given by $(x, y) = (x_0 + \frac{b}{d}t, y_0 - \frac{a}{d}t)$, $t \in \mathbb{Z}$. To find some solution (x_0, y_0) , use extended GCD to solve $ax_0 + by_0 = d = \gcd(a, b)$, and multiply its solutions by $\frac{c}{d}$.

Linear diophantine equation in n variables: $a_1x_1 + \dots + a_nx_n = c$ has solutions iff $\gcd(a_1, \dots, a_n)|c$. To find some solution, let $b = \gcd(a_2, \dots, a_n)$, solve $a_1x_1 + by = c$, and iterate with $a_2x_2 + \dots = y$.

Extended GCD

```
// Finds g = gcd(a,b) and x, y such that ax+by=g.
// Bounds: |x|<=b+1, |y|<=a+1.
void gcdext(int &g, int &x, int &y, int a, int b)
{ if (b == 0) { g = a; x = 1; y = 0; }
  else { gcdext(g, y, x, b, a % b); y = y - (a / b) * x; } }
```

Multiplicative inverse of a modulo m : x in $ax + my = 1$, or $a\phi(m)^{-1} \pmod{m}$.

Chinese Remainder Theorem. System $x \equiv a_i \pmod{m_i}$ for $i = 1, \dots, n$, with pairwise relatively-prime m_i has a unique solution modulo $M = m_1m_2 \dots m_n$: $x = a_1b_1\frac{M}{m_1} + \dots + a_nb_n\frac{M}{m_n} \pmod{M}$, where b_i is modular inverse of $\frac{M}{m_i}$ modulo m_i .

System $x \equiv a \pmod{m}$, $x \equiv b \pmod{n}$ has solutions iff $a \equiv b \pmod{g}$, where $g = \gcd(m, n)$. The solution is unique modulo $L = \frac{mn}{g}$, and equals: $x \equiv a + T(b-a)m/g \equiv b + S(a-b)n/g \pmod{L}$, where S and T are integer solutions of $mT + nS = \gcd(m, n)$.

Prime-counting function. $\pi(n) = |\{p \leq n : p \text{ is prime}\}|$. $n/\ln(n) < \pi(n) < 1.3n/\ln(n)$. $\pi(1000) = 168$, $\pi(10^6) = 78498$, $\pi(10^9) = 50\,847\,534$. n -th prime $\approx n \ln n$.

Miller-Rabin's primality test. Given $n = 2^r s + 1$ with odd s , and a random integer $1 < a < n$.

If $a^s \equiv 1 \pmod{n}$ or $a^{2^j s} \equiv -1 \pmod{n}$ for some $0 \leq j \leq r-1$, then n is a probable prime. With bases 2, 7 and 61, the test identifies all composites below 2^{32} . Probability of failure for a random a is at most $1/4$.

Pollard- ρ . Choose random x_1 , and let $x_{i+1} = x_i^2 - 1 \pmod{n}$. Test $\gcd(n, x_{2k+i} - x_{2k})$ as possible n 's factors for $k = 0, 1, \dots$. Expected time to find a factor: $O(\sqrt{m})$, where m is smallest prime power in n 's factorization. That's $O(n^{1/4})$ if you check $n = p^k$ as a special case before factorization.

Fermat primes. A Fermat prime is a prime of form $2^{2^n} + 1$. The only known Fermat primes are 3, 5, 17, 257, 65537. A number of form $2^n + 1$ is prime only if it is a Fermat prime.

Perfect numbers. $n > 1$ is called perfect if it equals sum of its proper divisors and 1. Even n is perfect iff $n = 2^{p-1}(2^p - 1)$ and $2^p - 1$ is prime (Mersenne's). No odd perfect numbers are yet found.

Carmichael numbers. A positive composite n is a Carmichael number ($a^{n-1} \equiv 1 \pmod{n}$) for all a : $\gcd(a, n) = 1$, iff n is square-free, and for all prime divisors p of n , $p-1$ divides $n-1$.

Number/sum of divisors. $\tau(p_1^{a_1} \dots p_k^{a_k}) = \prod_{j=1}^k (a_j + 1)$. $\sigma(p_1^{a_1} \dots p_k^{a_k}) = \prod_{j=1}^k \frac{p_j^{a_j+1} - 1}{p_j - 1}$.

Euler's phi function. $\phi(n) = |\{m \in \mathbb{N}, m \leq n, \gcd(m, n) = 1\}|$.
 $\phi(mn) = \frac{\phi(m)\phi(n)\gcd(m, n)}{\phi(\gcd(m, n))}$. $\phi(p^a) = p^{a-1}(p-1)$. $\sum_{d|n} \phi(d) = \sum_{d|n} \phi(\frac{n}{d}) = n$.

Euler's theorem. $a^{\phi(n)} \equiv 1 \pmod{n}$, if $\gcd(a, n) = 1$.

Wilson's theorem. p is prime iff $(p-1)! \equiv -1 \pmod{p}$.

Mobius function. $\mu(1) = 1$. $\mu(n) = 0$, if n is not squarefree. $\mu(n) = (-1)^s$, if n is the product of s distinct primes. Let f, F be functions on positive integers. If for all $n \in \mathbb{N}$, $F(n) = \sum_{d|n} f(d)$, then $f(n) = \sum_{d|n} \mu(d)F(\frac{n}{d})$, and vice versa. $\phi(n) = \sum_{d|n} \mu(d)\frac{n}{d}$. $\sum_{d|n} \mu(d) = 1$.

If f is multiplicative, then $\sum_{d|n} \mu(d)f(d) = \prod_{p|n} (1 - f(p))$, $\sum_{d|n} \mu(d)^2 f(d) = \prod_{p|n} (1 + f(p))$.

Legendre symbol. If p is an odd prime, $a \in \mathbb{Z}$, then $(\frac{a}{p})$ equals 0, if $p|a$; 1 if a is a quadratic residue modulo p ; and -1 otherwise. Euler's criterion: $(\frac{a}{p}) = a^{(\frac{p-1}{2})} \pmod{p}$.

Jacobi symbol. If $n = p_1^{a_1} \dots p_k^{a_k}$ is odd, then $(\frac{a}{n}) = \prod_{i=1}^k (\frac{a}{p_i})^{k_i}$.

Primitive roots. If the order of g modulo m ($\min n > 0: g^n \equiv 1 \pmod{m}$) is $\phi(m)$, then g is called a primitive root. If Z_m has a primitive root, then it has $\phi(\phi(m))$ distinct primitive roots. Z_m has a primitive root iff m is one of 2, 4, p^k , $2p^k$, where p is an odd prime. If Z_m has a primitive root g , then for all a coprime to m , there exists unique integer $i = \text{ind}_g(a)$ modulo $\phi(m)$, such that $g^i \equiv a \pmod{m}$. $\text{ind}_g(a)$ has logarithm-like properties: $\text{ind}(1) = 0$, $\text{ind}(ab) = \text{ind}(a) + \text{ind}(b)$.

If p is prime and a is not divisible by p , then congruence $x^n \equiv a \pmod{p}$ has $\gcd(n, p-1)$ solutions if $a^{(p-1)/\gcd(n, p-1)} \equiv 1 \pmod{p}$, and no solutions otherwise. (Proof sketch: let g be a primitive root, and $g^i \equiv a \pmod{p}$, $g^u \equiv x \pmod{p}$. $x^n \equiv a \pmod{p}$ iff $g^{nu} \equiv g^i \pmod{p}$ iff $nu \equiv i \pmod{p}$.)

Discrete logarithm problem. Find x from $a^x \equiv b \pmod{m}$. Can be solved in $O(\sqrt{m})$ time and space with a meet-in-the-middle trick. Let $n = \lceil \sqrt{m} \rceil$, and $x = ny - z$. Equation becomes $a^{ny} \equiv ba^z \pmod{m}$. Precompute all values that the RHS can take for $z = 0, 1, \dots, n-1$, and brute force y on the LHS, each time checking whether there's a corresponding value for RHS.

Pythagorean triples. Integer solutions of $x^2 + y^2 = z^2$. All relatively prime triples are given by: $x = 2mn, y = m^2 - n^2, z = m^2 + n^2$ where $m > n, \gcd(m, n) = 1$ and $m \not\equiv n \pmod{2}$. All other triples are multiples of these. Equation $x^2 + y^2 = 2z^2$ is equivalent to $(\frac{x+y}{2})^2 + (\frac{x-y}{2})^2 = z^2$.

Postage stamps/McNuggets problem. Let a, b be relatively-prime integers. There are exactly $\frac{1}{2}(a-1)(b-1)$ numbers *not* of form $ax + by$ ($x, y \geq 0$), and the largest is $(a-1)(b-1) - 1 = ab - a - b$.

Fermat's two-squares theorem. Odd prime p can be represented as a sum of two

squares iff $p \equiv 1 \pmod{4}$. A product of two sums of two squares is a sum of two squares. Thus, n is a sum of two squares iff every prime of form $p = 4k+3$ occurs an even number of times in n 's factorization.

RSA. Let p and q be random distinct large primes, $n = pq$. Choose a small odd integer e , relatively prime to $\phi(n) = (p-1)(q-1)$, and let $d = e^{-1} \pmod{\phi(n)}$. Pairs (e, n) and (d, n) are the public and secret keys, respectively. Encryption is done by raising a message $M \in Z_n$ to the power e or d , modulo n .

String Algorithms

Burrows-Wheeler inverse transform. Let $B[1..n]$ be the input (last column of sorted matrix of string's rotations.) Get the first column, $A[1..n]$, by sorting B . For each k -th occurrence of a character c at index i in A , let $next[i]$ be the index of corresponding k -th occurrence of c in B . The r -th row of the matrix is $A[r], A[next[r]], A[next[next[r]]], \dots$

Huffman's algorithm. Start with a forest, consisting of isolated vertices. Repeatedly merge two trees with the lowest weights.

Graph Theory

Euler's theorem. For any planar graph, $V - E + F = 1 + C$, where V is the number of graph's vertices, E is the number of edges, F is the number of faces in graph's planar drawing, and C is the number of connected components. Corollary: $V - E + F = 2$ for a 3D polyhedron.

Vertex covers and independent sets. Let M, C, I be a max matching, a min vertex cover, and a max independent set. Then $|M| \leq |C| = N - |I|$, with equality for bipartite graphs. Complement of an MVC is always a MIS, and vice versa. Given a bipartite graph with partitions (A, B) , build a network: connect source to A , and B to sink with edges of capacities, equal to the corresponding nodes' weights, or 1 in the unweighted case. Set capacities of the original graph's edges to the infinity. Let (S, T) be a minimum s - t cut. Then a maximum(-weighted) independent set is $I = (A \cap S) \cup (B \cap T)$, and a minimum(-weighted) vertex cover is $C = (A \cap T) \cup (B \cap S)$.

Matrix-tree theorem. Let matrix $T = [t_{ij}]$, where t_{ij} is the number of multiedges between i and j , for $i \neq j$, and $t_{ii} = -\deg_i$. Number of spanning trees of a graph is equal to the determinant of a matrix obtained by deleting any k -th row and k -th column from T .

Euler tours. Euler tour in an undirected graph exists iff the graph is connected and each vertex has an even degree. Euler tour in a directed graph exists iff in-degree of each vertex equals its out-degree, and underlying undirected graph is connected. Construction:

```
doit(u) :
  for each edge e = (u, v) in E, do: erase e, doit(v)
  prepend u to the list of vertices in the tour
```

Stable marriages problem. While there is a free man m : let w be the most-preferred woman to whom he has not yet proposed, and propose m to w . If w is free, or is engaged to someone whom she prefers less than m , match m with w , else deny proposal.

Stoer-Wagner's min-cut algorithm. Start from a set A containing an arbitrary vertex. While $A \neq V$, add to A the most tightly connected vertex ($z \notin A$ such that

$\sum_{x \in A} w(x, z)$ is maximized.) Store cut-of-the-phase (the cut between the last added vertex and rest of the graph), and merge the two vertices added last. Repeat until the graph is contracted to a single vertex. Minimum cut is one of the cuts-of-the-phase.

Tarjan's offline LCA algorithm. (Based on DFS and union-find structure.)

```
DFS(x) :
  ancestor[Find(x)] = x
  for all children y of x:
    DFS(y); Union(x, y); ancestor[Find(x)] = x
  seen[x] = true
  for all queries {x, y}:
    if seen[y] then output "LCA(x, y) is ancestor[Find(y)]"
```

Strongly-connected components. Kosaraju's algorithm.

1. Let G^T be a transpose G (graph with reversed edges.)
1. Call $\text{DFS}(G^T)$ to compute finishing times $f[u]$ for each vertex u .
3. For each vertex u , in the order of decreasing $f[u]$, perform $\text{DFS}(G, u)$.
4. Each tree in the 3rd step's DFS forest is a separate SCC.

2-SAT. Build an implication graph with 2 vertices for each variable – for the variable and its inverse; for each clause $x \vee y$ add edges (\bar{x}, y) and (\bar{y}, x) . The formula is satisfiable iff x and \bar{x} are in distinct SCCs, for all x . To find a satisfiable assignment, consider the graph's SCCs in topological order from sinks to sources (i.e. Kosaraju's last step), assigning 'true' to all variables of the current SCC (if it hasn't been previously assigned 'false'), and 'false' to all inverses.

Randomized algorithm for non-bipartite matching. Let G be a simple undirected graph with even $|V(G)|$. Build a matrix A , which for each edge $(u, v) \in E(G)$ has $A_{i,j} = x_{i,j}$, $A_{j,i} = -x_{i,j}$, and is zero elsewhere. Tutte's theorem: G has a perfect matching iff $\det G$ (a multivariate polynomial) is identically zero. Testing the latter can be done by computing the determinant for a few random values of $x_{i,j}$'s over some field. (e.g. Z_p for a sufficiently large prime p)

Prufer code of a tree. Label vertices with integers 1 to n . Repeatedly remove the leaf with the smallest label, and output its only neighbor's label, until only one edge remains. The sequence has length $n - 2$. Two isomorphic trees have the same sequence, and every sequence of integers from 1 and n corresponds to a tree. Corollary: the number of labelled trees with n vertices is n^{n-2} .

Erdos-Gallai theorem. A sequence of integers $\{d_1, d_2, \dots, d_n\}$, with $n - 1 \geq d_1 \geq d_2 \geq \dots \geq d_n \geq 0$ is a degree sequence of some undirected simple graph iff $\sum d_i$ is even and $d_1 + \dots + d_k \leq k(k - 1) + \sum_{i=k+1}^n \min(k, d_i)$ for all $k = 1, 2, \dots, n - 1$.

Games

Grundy numbers. For a two-player, normal-play (last to move wins) game on a graph (V, E) : $G(x) = \text{mex}(\{G(y) : (x, y) \in E\})$, where $\text{mex}(S) = \min\{n \geq 0 : n \notin S\}$. x is

losing iff $G(x) = 0$.

Sums of games.

- *Player chooses a game and makes a move in it.* Grundy number of a position is xor of grundy numbers of positions in summed games.
- *Player chooses a non-empty subset of games (possibly, all) and makes moves in all of them.* A position is losing iff each game is in a losing position.
- *Player chooses a proper subset of games (not empty and not all), and makes moves in all chosen ones.* A position is losing iff grundy numbers of all games are equal.
- *Player must move in all games, and loses if can't move in some game.* A position is losing if any of the games is in a losing position.

Misère Nim. A position with pile sizes $a_1, a_2, \dots, a_n \geq 1$, not all equal to 1, is losing iff $a_1 \oplus a_2 \oplus \dots \oplus a_n = 0$ (like in normal nim.) A position with n piles of size 1 is losing iff n is *odd*.

Bit tricks

Clearing the lowest 1 bit: $x \& (x - 1)$, all trailing 1's: $x \& (x + 1)$

Setting the lowest 0 bit: $x | (x + 1)$

Enumerating subsets of a bitmask m :

```
x=0; do { ...; x=(x+1~m)&m; } while (x!=0);
```

`__builtin_ctz`/`__builtin_clz` returns the number of trailing/leading zero bits.

`__builtin_popcount`(unsigned x) counts 1-bits (slower than table lookups).

For 64-bit unsigned integer type, use the suffix 'll', i.e. `__builtin_popcountll`.

Math

Stirling's approximation $z! = \Gamma(z+1) = \sqrt{2\pi} z^{z+1/2} e^{-z} (1 + \frac{1}{12z} + \frac{1}{288z^2} - \frac{139}{51840z^3} + \dots)$

Taylor series. $f(x) = f(a) + \frac{x-a}{1!} f'(a) + \frac{(x-a)^2}{2!} f''(a) + \dots + \frac{(x-a)^n}{n!} f^{(n)}(a) + \dots$

$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \dots$

$\ln x = 2(a + \frac{a^3}{3} + \frac{a^5}{5} + \dots)$, where $a = \frac{x-1}{x+1}$. $\ln x^2 = 2 \ln x$.

$\arctan x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots$, $\arctan x = \arctan c + \arctan \frac{x-c}{1+xc}$ (e.g $c=.2$)

$\pi = 4 \arctan 1$, $\pi = 6 \arcsin \frac{1}{2}$

List of Primes
